From time to time, I find reviewing very difficult. When writing notes and understanding them require a significant efforts to get in the zone, the deep understanding and connections that you have by then might disappear now. The review is therefore needed, but when one think about the amount of efforts to reignite the connection, one is burnt out to start with. I truly believe humans can only remember so much at a time, but the recall is something one can train on. Recently, I have been playing piano. The effort of reading the piece and practicing the hand position is large and challenging. But at the end, it is very rewarding! However, the notes and hand position which one focus on a lot is not the first thing they recall when thinking about the piece. It is the melody, and then the chords that made up the melody, and how to switch between chords rather remembering every single notes. When writing notes and understanding the materials, the step is needed just as learning the new piece. The melody is like the activator which reminds one the pictures (chords), the formulas (connection between chords).

The recommendation for note taking is to create the activators: the questions of why we write the notes in the first place. Inside, one should have the physical pictures and connections to train the recalling process. This allows each neuron as an activator for a concept one want to review. This helps saving time and efforts to recreating the playground again.
